

NATURAL GAS & PROPANE GAS VENTS

The Gunnison Fire Department and the City of Gunnison Building Department would like to remind everyone who has propane or natural gas appliances with vents penetrating their roof need to check these vents for any blockage or damage due to the recent snow storms. It is critical that these vents remain open and functional as carbon monoxide can and will enter the house which may result in deadly consequences. Both business owners and homeowners should check these vents as soon as possible and have them repaired if there is any indication of damage.

Examples of some of these appliances are furnaces, boilers, hot water heaters and vented room heaters.

If you have any questions about carbon monoxide or gas venting of appliances call the Fire Marshal at 641-8153 or the Building Official at 641-8151
